Written Scenarios

Scenario 1

A player is instantiated in a room and receives information on what is present in the room. The room replies that the east direction is open for navigation, but the north and west directions are impassable while the south is blocked by a monster. The monster does damage of –5 to the player. The player navigates through the east passage to another room. In this room, there are fixtures including a bookcase, a table, and a chair. There are two items present in the room: a piece of paper with writing on it and a feather. There is also a computer that asks the player to enter a password, and its message obscures the room description. The passage that he entered through is now the west passage from the current room. There are no additional open passages to other rooms from this room. Next, the player adds the paper and feather items to his inventory. Finally, the player travels back through the western passage that he arrived from, going back to the starting room.

Back in the original room, the player is given the same information about a monster blocking the north and west passages. The monster attacks the player, causing the player to lose five points of health. Then, the player takes out the paper with magic writing on it and uses it on the monster. The monster is defeated by magic words written on the paper and becomes inactive. The player receives 100 points. The monster now has no effect on the room, and the northern and western passages are now open for the player to travel through.

Scenario 2

A player is instantiated in a room with the name “Living Room.” The player is named “Tony” and starts with half health and a carrying capacity of thirteen with nothing in his inventory, so the current weight of the player’s inventory is zero. The player is told that the south passage is blocked by a monster while the west passage is open for navigation. The north and east passages are impassable. There is a TV fixture in the room.

The player navigates through the west passage and enters a new room with the name “Kitchen.” The player inspects the current room and is told that there is one fixture, a refrigerator; an item, a frozen chicken; and a puzzle. The player inspects the refrigerator and is told that it is large and cold. The player inspects the chicken and is told that it weighs two units. The player adds the chicken to his inventory.

Next, the player inspects the puzzle. The puzzle says, “this is a prime cabinet with six drawers.” The player enters the following sequence as a text answer: 1, 3, 5, 7, 11, 13. The player receives a message that the puzzle is solved and that his points have increased by 50. Finally, the player goes back through the east passage to the Living Room.
